

Cutting Edges / Grader Blades

Great West Equipment edges and blades are made from high quality boron steel and are engineered to provide some of the longest wear in the industry.

What is Boron?

Boron is not just another “tag word”. It is an element that when added to steel **maintains the hardness** of the steel **throughout the material**.

Have you ever had an edge wear great initially – then wear incredibly fast?

Heat treating **only** penetrates slightly into the core. This leaves softer, more quickly wearable material behind it.

Great West Equipment’s boron material is added during the heat-treating process. This allows the steel to **harden further into the core** of the edge **resulting in a harder, longer lasting and more durable product**.
